

Q52. Which of the following is an appropriate statement in regard to a module unit test?

- a) Generally, test cases are created and executed by dedicated testing staff, not programmers who have done the coding.
- b) The module design documents have already been verified. If a problem is found in the test results, an error exists in the test case or the module.
- c) The module interface falls outside the scope of the unit test because the module interface cannot be tested using a single module.
- d) Verification should be performed, in principle, using test cases which cover all the logic paths at least once while reviewing the module design documents.
